

BUSINESS INSIGHTS

Project Title:

Retail & E-Commerce Sales Performance Analysis

1. Objective

The objective of this document is to present the key business insights identified during the Exploratory Data Analysis (EDA) and Power BI dashboard development. These insights summarize important trends, performance patterns, and business observations that help stakeholders understand the overall performance of the retail and e-commerce business.

2. Business Insights

Insight 1: Monthly Sales Performance

Sales fluctuated throughout the year, indicating seasonal demand patterns. September recorded the highest monthly sales, while October experienced the lowest sales. Business performance improved again during the final months of the year.

Insight 2: Product Category Performance

Electronics generated the highest sales and profit, making it the strongest-performing product category. Furniture also performed well, while Office Supplies contributed the lowest sales and profit.

Insight 3: Sub-Category Performance

Accessories generated the highest sales among all sub-categories, whereas Office generated the highest profit. This indicates that higher sales do not always result in higher profitability.

Insight 4: Product Performance

Keyboard was the highest-selling product, while Chair generated the highest profit. Laptop recorded the lowest sales, and Printer Paper generated the lowest profit.

Insight 5: Brand Performance

HP generated the highest sales among all brands, while IKEA generated the highest profit. This shows that different brands excel in different performance metrics.

Insight 6: Customer Segment Performance

The Corporate customer segment contributed the highest sales and profit, making it the most valuable customer group. Consumer ranked second, while Home Office generated the lowest contribution.

Insight 7: Regional Performance

The West region achieved the highest sales, while the South region generated the highest profit. Maharashtra recorded the highest sales among all states, whereas Karnataka generated the highest profit.

Insight 8: Shipping Mode Performance

First Shipping generated the highest sales, while Second Shipping processed the highest number of customer orders, indicating different customer preferences based on order value.

Insight 9: Payment Method Preference

Card was the most preferred payment method, generating the highest sales and order count. UPI also showed strong customer adoption, while Cash recorded the lowest usage.

Insight 10: Discount Analysis

A 5% discount generated the highest sales, while profit decreased as discount levels increased. Excessively high discounts contributed very little to overall business performance.

Insight 11: Return Analysis

Wrong Item was the most common return reason, followed by Damaged products and Customer Returns. Pen recorded the highest number of returned orders among all products.

Insight 12: Overall Business Performance

The business generated strong overall sales and maintained a positive profit margin. However, the current return rate indicates opportunities to improve order fulfillment and reduce product returns.

3. Summary

The analysis identified strong performance in Electronics, Corporate customers, the West region, and Card payments. It also highlighted opportunities to improve lower-performing categories, optimize discount strategies, reduce returns, and strengthen regional performance. These insights provide valuable guidance for making informed business decisions and improving overall business performance.
